

Pictorial Quiz

Hafsa Quader¹, Imran Khan²

Case scenario

A 23 years male was admitted with pain in right lower abdomen since 4 to 5 months and vomiting for 1 day. Pain was sudden in onset, sharp in intensity, relieved by taking analgesics, aggravated by taking food and associated with vomiting. Vomitus contained food particles. There were no urinary symptom. On examination abdomen was soft, tender at right iliac fossa and hypogastrium. A mass

of about 7 x 5 cm was palpable in right iliac fossa. On genital examination right side of scrotum was poorly developed and left side was fully developed. On per rectal examination right lateral wall of rectum was tender. Ultrasound abdomen showed a well-defined hyperechoic area 7.0 x 6.9 cm in right side of lower abdomen; could be appendicular lump. Exploratory laparotomy was done and a mass of 10 x 8 cm arising from posterior abdominal wall was excised.

What is your diagnosis ?

¹⁻² Department of Surgery, Unit-II,
Abbasi Shaheed Hospital, Karachi
